WEB DEVELOPMENT

ACTIVITY-BASED LEARNING (ABL) ASSIGNMENT REPORT

Three Website Case Studies

STUDENT DETAILS

Name	Ushaswini Parvataneni
Roll Number	26000981
Branch	CSM
Section	2

Prepared as a short report on the design, purpose, features, and learning outcomes of three beginner-friendly websites created using HTML and CSS.

1. Introduction

Web development is the process of creating websites that people can view and use through a web browser. In this Activity-Based Learning assignment, three simple website designs were planned: a personal portfolio, a college information website, and an online learning platform. The websites use HTML to arrange content and CSS to style the pages. The work helped connect classroom concepts with a practical activity.

Objectives of the Assignment

- Understand the basic structure of an HTML document.
- Use headings, paragraphs, links, sections, and containers to organize information.
- Apply CSS colours, spacing, backgrounds, borders, and typography to improve appearance.
- Create navigation links that move visitors to different sections of a page.
- Practise designing clear, readable, and beginner-friendly web pages.

Technologies Used

Technology	Purpose
HTML	Creates the structure and content of each website.
CSS	Controls colours, layout, spacing, text styles, and visual presentation.
Web Browser	Displays the website so that the design can be checked.

Note: These are front-end demonstration websites. Features such as login, saving user data, and real course enrolment would need additional programming and, in many cases, a server or database.

2. Case Study One: My Portfolio Website

Purpose: A portfolio website is a personal web page used to introduce its owner and present skills, projects, and contact information. It can act as a simple online profile for classmates, teachers, or future internship reviewers.

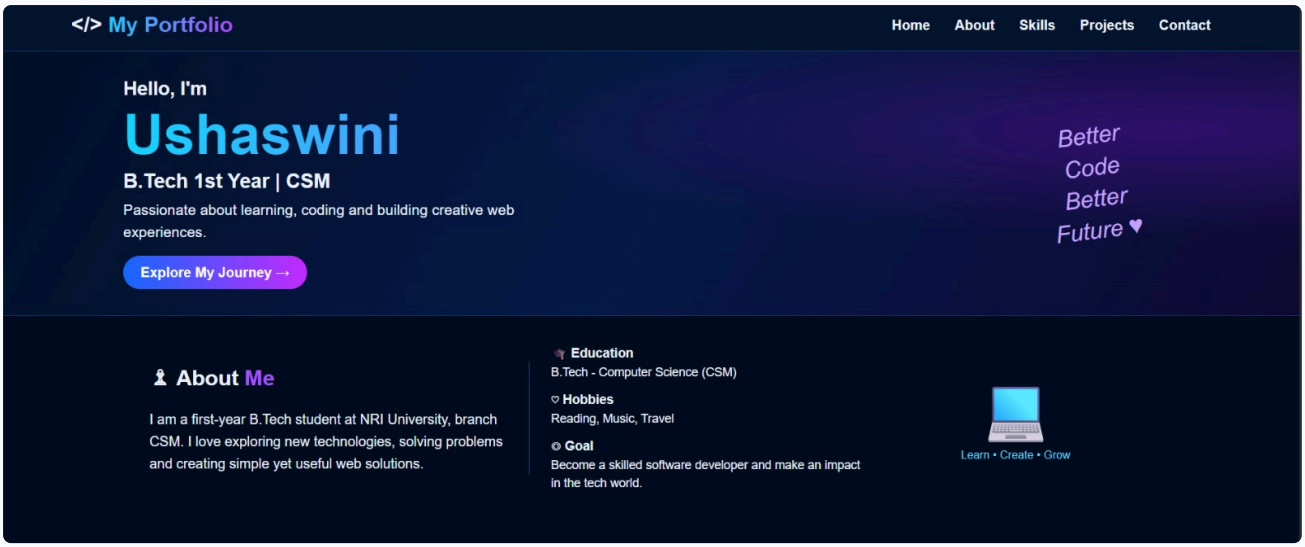

Figure 2.1: My Portfolio Hero Banner & About Section

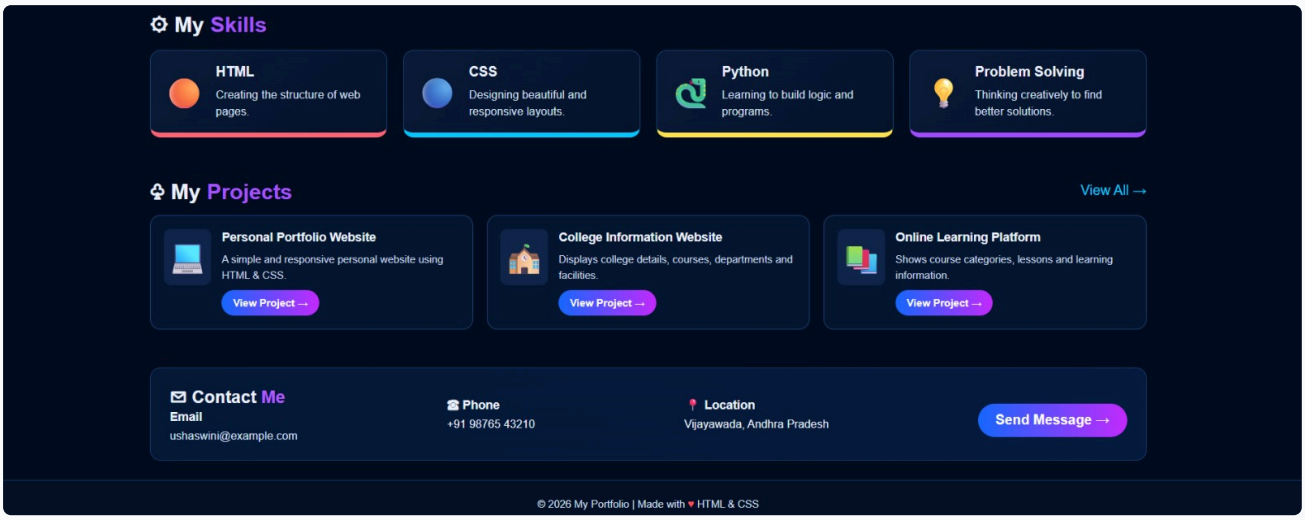

Figure 2.2: My Portfolio Skills, Projects & Contact Section

Main Sections and Features

- **Home:** Welcomes visitors and introduces the student.
- **About:** Gives a short introduction and educational background.
- **Skills:** Lists beginner skills, such as HTML and CSS.
- **Projects:** Shows projects completed as part of coursework.
- **Contact:** Provides a way to find contact details.

Use of HTML and CSS

HTML is used for headings, paragraphs, navigation links, and project sections. CSS creates the visual style using a dark background, contrasting text, coloured accents, spacing, and card-like project areas. Navigation links can jump to sections on the same page. A responsive layout can also help the page fit smaller screens.

Learning Outcome: Demonstrates how to present personal information in an organized and professional way

3. Case Study Two: College Information Website

Purpose: A college information website shares important details about an educational institution in one place. It helps students and visitors quickly find information about the college, courses, facilities, and contact details.

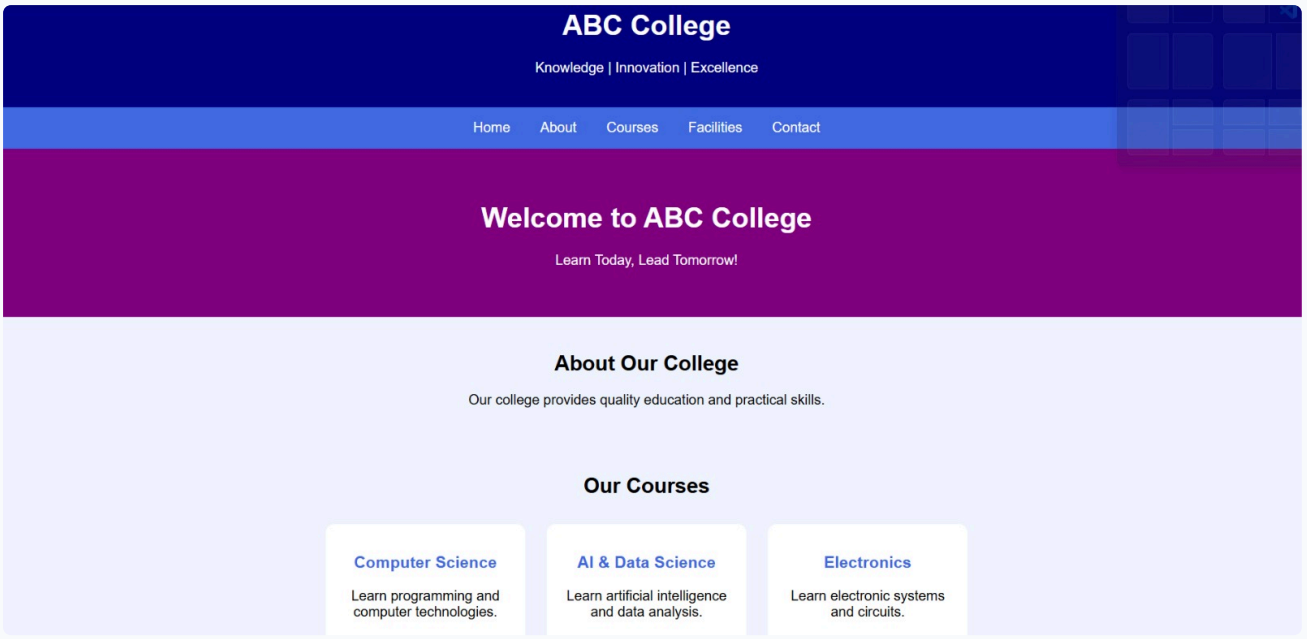

Figure 3.1: College Website Navigation & Courses

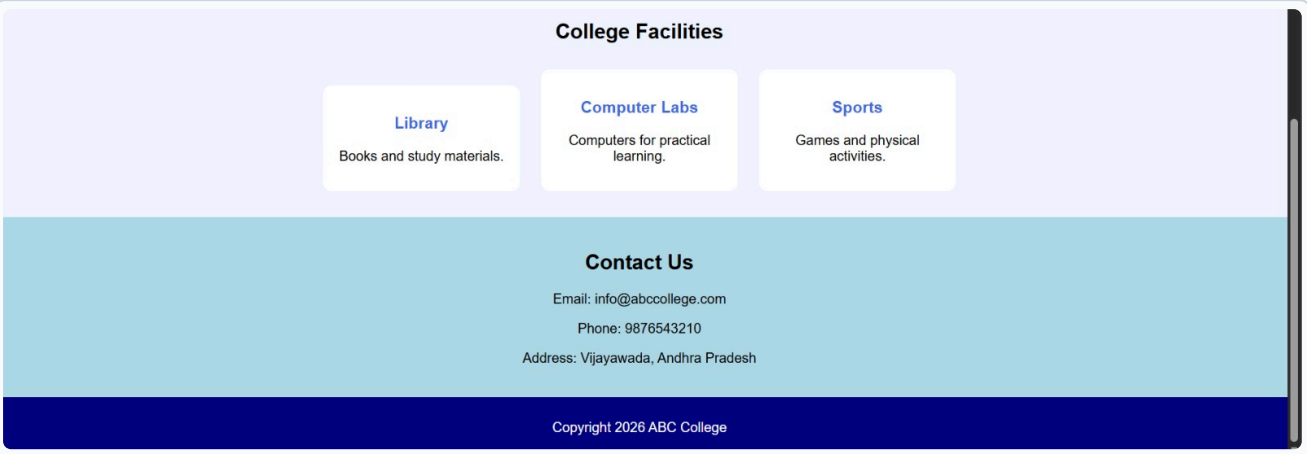

Figure 3.2: Facilities Section & Footer Details

Main Sections and Features

- **Header & Nav:** Displays college name, tagline, and section links.
- **About section:** Brief description of the college and educational purpose.
- **Courses section:** Presents course cards (Computer Science, AI & DS, Electronics).
- **Facilities section:** Highlights library, computer labs, and sports services.
- **Contact section:** Displays sample email, phone, and address details.

Use of HTML and CSS

HTML divides the page into meaningful sections and uses links to connect the navigation menu. CSS styles the header, navigation bar, welcome banner, and information cards. Background colours, borders, rounded corners, and spacing make content easy to scan.

Learning Outcome: Practical experience in presenting structured information, grouping related content, using

4. Case Study Three: Online Learning Platform Website

Purpose: An online learning platform website introduces educational courses that learners can explore through the internet. The sample LearnOnline page is designed to show how course information can be organized clearly for beginner learners.

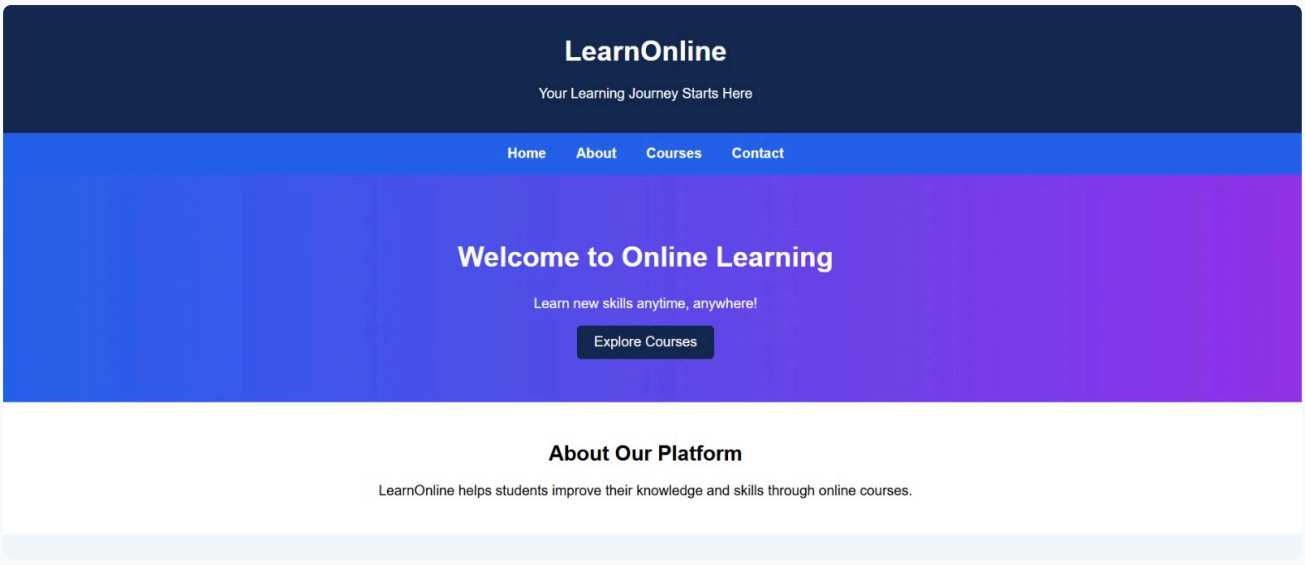

Figure 4.1: LearnOnline Header & Welcome Banner

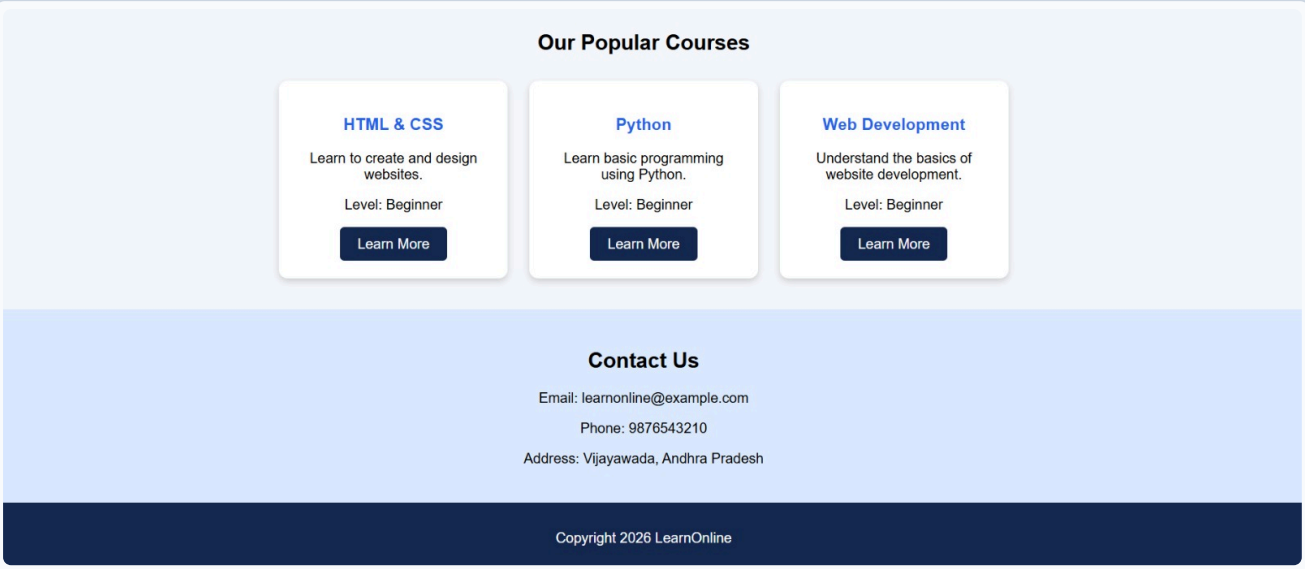

Figure 4.2: Popular Courses Cards & Contact Footer

Main Sections and Features

- **Header & Banner:** Platform branding and gradient banner with CTA.
- **About section:** Explains the platform's purpose and learning approach.
- **Course cards:** Introduces HTML & CSS, Python, and Web Development.
- **Contact & Footer:** Sample contact details and copyright statement.

Use of HTML and CSS

HTML structures the header, navigation, banner, course cards, and contact section. CSS uses a vibrant blue-to-purple gradient banner, clean white course cards, rounded corners, drop accents, and button hover states to build an engaging aesthetic.

5. Comparison of the Three Websites

Website	Primary Purpose	Key Sections & Components
My Portfolio	Introduce a student and showcase individual work and skills.	About, Skills grid, Project cards, Contact information.
College Information	Share institutional details, academics, and facilities.	Courses offered, Campus facilities, Nav menu, Contact details.
Online Learning Platform	Present learning options and course offerings to prospective students.	Welcome hero banner, Course catalog cards, Call-to-action links.

Conclusion

Through these three website case studies, I practised using HTML to organize content and CSS to make pages more attractive and readable. The portfolio website focuses on personal presentation, the college website organizes institutional information, and the online learning platform presents courses for learners. Each project serves a unique purpose while sharing fundamental front-end development concepts.

Skills Practised

- Writing a structured HTML document and organizing content using semantic tags.
- Applying CSS selectors, color palettes, custom gradients, padding, margins, and borders.
- Designing navigation links and modular card layouts for projects and courses.
- Ensuring visual consistency and considering responsive behaviors for smaller screens.
- Understanding the functional distinction between visual front-end interfaces and full-stack web applications.
